# 1 System Overview

All datasets and Python scripts are available in the GitHub repository:

<https://github.com/stokeya/Books-Recommendation-System-Part2->

The project is structured as follows:

- `data_cleanup.py`: Cleans and merges datasets.
- `test_data.py`: Splits the dataset into training and testing sets.
- `bookrecsystemcleaned.py`: Implements the recommendation logic.

## 2 Development Environment

Developers can use either VS Code or PyCharm to run and modify the scripts. Ensure Python 3.7 or higher is installed along with all required libraries.

## 3 Key Components

### 3.1 `data_cleanup.py`

This script processes two raw datasets by cleaning null values, removing unnecessary columns, and merging the data.

```
1 merged_df = pd.merge(ratings_df, data_df)
2 merged_df.dropna(subset=['Title'], inplace=True)
3 merged_df.to_csv('Resources/complete_cleaned_data.csv')
```

Listing 1: Example: Cleaning and Merging Datasets

### 3.2 `test_data.py`

This script splits the cleaned dataset into training and testing subsets.

```
1 test_data = unique_titles.sample(n=100000, random_state=42)
2 train_data = data_df[~data_df["Title"].isin(test_data["Title"])]
3 test_data.to_csv("test_dataset.csv")
4 train_data.to_csv("train_dataset.csv")
```

Listing 2: Example: Dataset Splitting

### 3.3 `bookrecsystemcleaned.py`

This script performs sentiment analysis using TextBlob and implements a kNN-based recommendation system.

```
1 def analyze_sentiment(text):
2     blob = TextBlob(text)
3     return round((blob.sentiment.polarity + 1) * 2 + 1)
```

Listing 3: Sentiment Analysis

## 4 Future Development

- Incorporate advanced NLP models like transformers for sentiment analysis.
- Build a GUI for better user experience.
- Add hierarchical filtering for categories and genres.
